

## R6 Deep-sea mining

Proposer: Les Jeunes Écologistes, Grønn Ungdom,  
Juventud Verde  
Agenda item: 4. Resolutions

### Motion text

Mining resources comes with negative impacts on the environment that should be reduced to a minimum. At the same time, a just transition to a carbon-neutral society is only possible when key parts of our infrastructure are renewed. However, this transition requires mining resources in itself; cadmium is for example needed for the construction of solar panels. Some methods of mining are more harmful to the environment than other methods. Underwater mining is especially harmful to the environment and should therefore be prohibited.

According to [“Seas to risk” report](#): *“Areas approved for deep-sea mining (DSM) exploration now cover over 1.3 million square kilometres in the Pacific, Indian and Atlantic Oceans. Of the 30 exploration contracts the International Seabed Authority (ISA) has established so far, European contractors hold a total of nine. Countries sponsoring or holding contracts include Belgium, Bulgaria, Czech Republic, Slovakia, Poland, France, Germany and the UK”.*

The International Union for Conservation of Nature (IUCN) has launched a moratorium on deep-sea mining. It has called on its member states to implement a moratorium on deep-sea mining and the issuance of contracts for exploitation and exploration. Environmental and biodiversity NGOs have welcomed this measure.

But many European countries continue the race to exploit the mineral resources of the seabed even though this has devastating consequences on the 250,000 known living species and on the millions we do not yet know of and the fact that mining releases huge amounts of carbon, which reduces the capacity of the oceans to slow down climate change.

We can mention the [Solwara 1 project](#) planned to mine mineral-rich hydrothermal vents in the Bismarck Sea, part of the Pacific Ocean, not far from Bougainville Island. This is the first deep-sea mining project at the international level that was approved but then brought to a halt because of environmental destruction. Other tentative projects are the ones planned near the Canary Islands. The so-called “grandmothers of the Canary Islands” are composed of more

than 100 seamounts that cover the bottom of the sea, located about 269 miles south of the island of El Hierro. They are extinct submarine volcanoes with important mineral deposits of manganese crusts, polymetallic nodules, and phosphorites. The European Union has formally declared that the grandmothers of the Canary Islands are a strategic reserve of raw materials necessary for the energy transition.

On the other hand, European countries and the EU have made the security of the supply of raw materials one of their priorities. It encourages the exploration of new frontiers and innovative mining methods under the pretext that the ecological transition requires the use of rare minerals such as cobalt used for the batteries of electrical devices.

We refuse to use the ecological transition to go and exploit and destroy the seabed!

The "Sustainable Blue Economy" strategy adopted by the European Commission foresees that the EU defends the conditional exploitation of seabed mineral resources in the international area after sufficient research has been carried out on the impact on the marine environment, biodiversity, and human activities.

The Federation of Young European Greens (FYEG) is unambiguous: our biodiversity has to be protected – whether on land or underground.

We must make our continent a global leader in sustainable development. When building a sustainable Europe, we cannot forget to protect our seabed.

### **WHAT WE STAND FOR:**

- Ban on deep-sea mining in European waters as well as on the continent.
- Ban on processing minerals from the seabed in Europe and ban on importing products containing minerals from the seabed into Europe (similar to the ban on conflict minerals).
- Stop research projects for deep-sea mining.
- Increase waste recycling rates to 80% to recover raw materials. To increase waste recycling, European legislation should require producers to design products so that they can be easily recycled, for example by not mixing plastic with paper packaging.

- Producers have to sell products designed to last as long as possible. Producing products that stop working after an artificially short amount of time is not only a burden for the consumers, but also the environment since it increases demand for new products, and therefore resources. To alleviate the pressure on our environment, and to reduce the need for underwater mining, products with artificial lifetime limitations have to be entirely banned across Europe.

We call for respect for the biodiversity of the seabed and respect for the right of marine biodiversity to develop freely without human intervention.

Through this motion, we want to affirm our refusal to participate in this race for scarce resources which is destructive to our marine biodiversity and which brings nothing.
